1.1 Problem Statement and project Scope :

Tourists in Jordan face several challenges, including the lack of a unified platform that provides up-to-date and reliable information about tourist attractions, hotel bookings, transportation options, and local events. In addition, booking tours or services online remains difficult, and language barriers pose a significant problem for non-Arabic-speaking visitors. Therefore, there is a clear need for a user-friendly and comprehensive tourism platform that addresses these issues.

System Scope

Includes:

1. Updated information about tourist attractions, hotels, transportation, and events.
2. Search, booking, and reviews.
3. English language support for international tourists.

Does Not Include:

1. Organizing trips yourself.
2. Electronic payment (in the first phase).
3. Mobile application development (currently web-only).

1.2 Project Plan and Schedule

Figure 1: Gantt Chart of project

2. System Analysis

2.1 Functional Requirements

1. User Registration and Authentication

Users shall be able to create accounts, log in securely, and manage their personal profiles (e.g., update name, email, password).

2. Tourist Attraction Browsing

The system shall display categorized listings of tourist attractions with images, brief descriptions, and relevant metadata such as location, type, and popularity.

3. Advanced Search and Filtering

Users shall be able to search attractions, hotels, and events using filters such as location, type, price range, rating, and language availability.

4. User Review and Rating System

Registered users shall be able to rate places they visited and write public reviews to help guide other tourists.

5. Booking System (Hotels and Events)

The platform shall allow users to book accommodations and register for events or tours, either directly or via integrated third-party systems.

6. Interactive Map Integration

An interactive map shall be provided to display attraction locations and support navigation.

7. Multilingual Support

The website shall support at least Arabic and English, allowing users to switch between languages seamlessly.

8. Administrative Dashboard

Administrators shall be able to manage content (attractions, hotels, events), user accounts, and moderate reviews or reported content.

2.2 Use Case Diagram

The Use Case Diagram provides a high-level visualization of the system's functional requirements. It illustrates how different actors (such as tourists and administrators) interact with the system to achieve their goals. Each use case represents a specific functionality, such as booking a hotel, viewing attractions, or managing content.

This diagram helps in identifying the system boundaries, the main users, and their interactions, which is essential for understanding and planning the system's behavior.

3.2 User Interface (prototype)

TouristGuideSys Home Cities Hotels Events Attractions Bookings

Figure 5: Home Page (before login\sign up)

Figure 6: Home Page (after login\sign up)

Figure 7: Register Page (Sign Up)

Users can create a new account by entering their personal information. The entered data is stored in the database, allowing the user to access the system later.

Figure 8: Login

Figure 9: Invalid Login

If the entered email or password does not match any record in the database, an error message is displayed to inform the user of invalid login credentials.

Figure 10: Hotels Page

This page shows all hotels available in the selected city, allowing users to view hotel information and details.

Figure 11: Cities Page

Users can search for a city by name. If the city exists, the system filters and displays the matching result. If the searched city does not exist in the database, the system displays a “City Not Found” message. Ex: As salt

Admin Dashboard

Tourist Guide System Management Panel

Figure 12: Admin Dashboard

The Admin Dashboard provides a centralized interface for managing cities, hotels, events, attractions, bookings, and system data.
